

Amendments to the Abstract:

Please replace the Abstract on pages 75-76 with the following:

~~Management software, a management computer, and a management method~~
~~capable of visualizing connection relationships among a plurality of devices interconnected~~
~~over a storage network without the necessity of implementing connection information~~
~~acquiring means in an object computer have been unavailable in the past.~~ A computer system
in accordance with an embodiment of the present invention comprises an object computer, a
storage system in which data to be communicated to the object computer is stored, and a
management computer that manages the storage system and the object computer. The storage
system includes: an acquisition unit that acquires first connection information, which
contains a communication port identifier assigned of the object computer, and a
communication port identifier assigned to the communication port of the storage system,
from the object computer; and a communication unit that transmits the first connection
information to the management computer. The management computer includes a
communication unit that receives the first connection information from the storage system,
and a display that uses an output screen thereof to visualize the connection relationships
between the storage system and object computer on the basis of the first connection
information.
